EXP – 4 TASK ANALYSIS,USER FLOW AND WIREFRAME DESIGN

Aim:

To conduct task analysis for a mobile application and document the user flow, and to design corresponding wireframes using diagram tools like **Lucidchart (Free Tier)** or **Dia (Open Source)**.

Objective:

To understand how users interact with an application by identifying tasks, designing navigation flow, and creating low-fidelity wireframes for the interface.

Procedure:

Step 1: Select an Application

Choose an application scenario such as:

- Online shopping app
- Food delivery app
- Bus ticket booking app

For this experiment, an **Online Shopping App** is considered.

Step 2: Perform Task Analysis Identify

the main task of the user.

Example:
User wants to **purchase a product online**.

Break the task into smaller steps:

1. Open application
2. Login or Sign up
3. Browse products
4. Select product
5. Add to cart
6. Checkout
7. Enter address
8. Choose payment method

9. Confirm order
10. Receive order confirmation

Step 3: Create User Flow Diagram

Using **Lucidchart or Dia**, create a flowchart representing user navigation.

Flow example:

Start
↓
Open App
↓
Login / Sign Up
↓
Browse Products
↓
Select Product
↓
Add to Cart
↓
Checkout
↓
Enter Address
↓
Payment
↓
Order Confirmation
↓
End

Use shapes:

- Oval → Start/End
- Rectangle → Process
- Diamond → Decision

Step 4: Create Wireframes

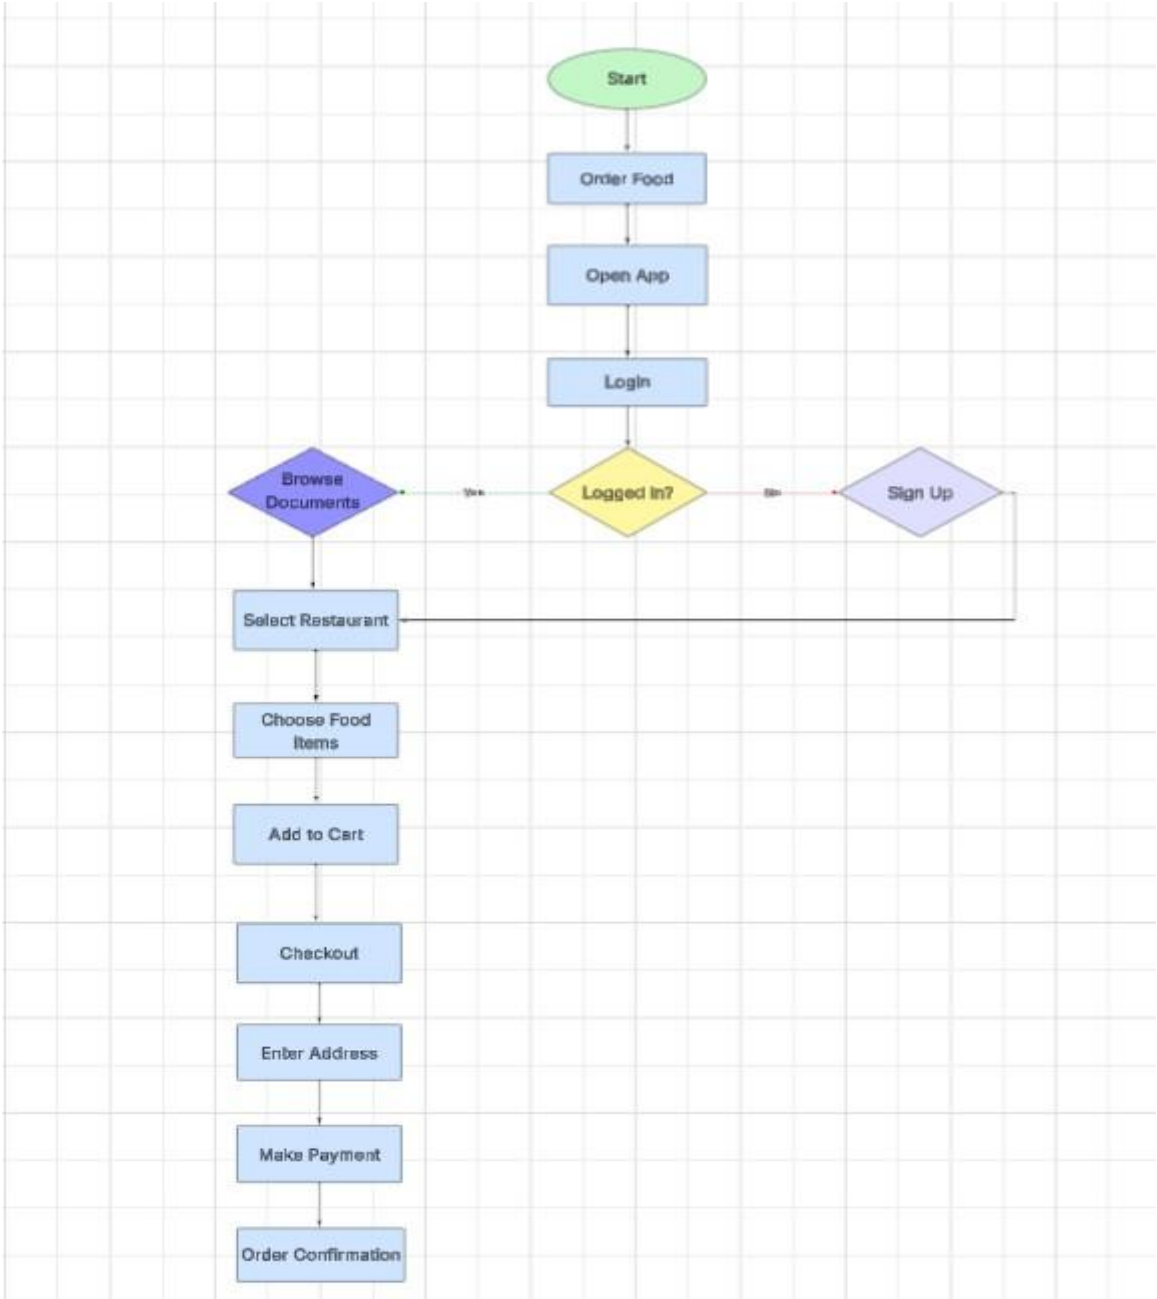
Design simple screen layouts representing the app interface.

Example wireframe screens:

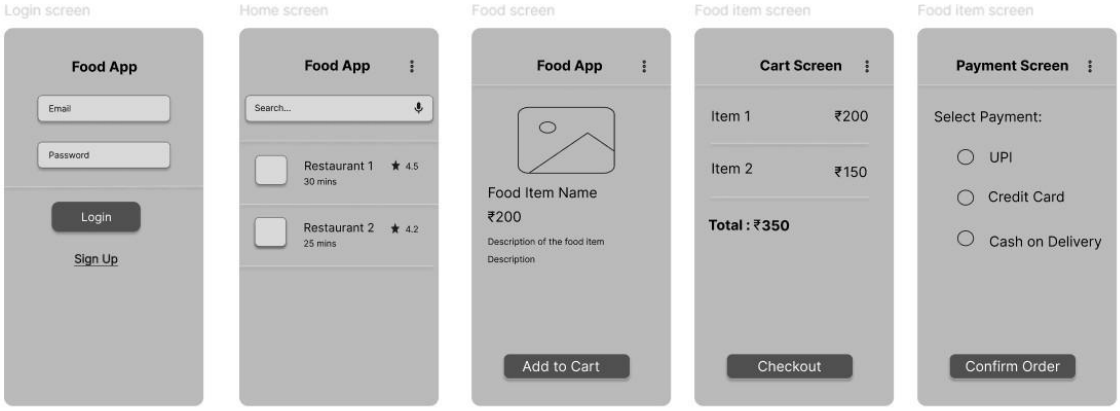
1. **Login Screen** ○ Email field ○ Password field ○ Login button ○ Sign-up link
2. **Home Screen** ○ Search bar ○ Product list ○ Categories
3. **Product Details Screen** ○ Product image ○ Product name ○ Price ○ Add to Cart button
4. **Cart Screen** ○ Product list ○ Total price ○ Checkout button
5. **Payment Screen** ○ Payment method selection ○ Confirm order button

These wireframes show the layout without colors or final design.

User Flow Diagram:



Wireframe Design:



Observation:

- Task analysis helps understand the sequence of user actions.
- User flow diagrams clarify navigation between screens.
- Wireframes provide a basic structure of the interface before final design.
- Using tools like Lucidchart or Dia simplifies diagram creation and improves clarity.

Result:

The task analysis, user flow diagram, and wireframe layouts for the selected application were successfully created using Lucidchart or Dia, demonstrating the interaction steps and screen structure of the application.
